

Pooled: short-trace-final, long-trace-final, inside-loop-state, post-loop-state  
Error probability versus Omega\_hat\_StateLoad

What it tracks: The reachable-value count summed over every recorded state observation in the exact run.

P(wrong = 1)

$\Omega_{\text{hat\_StateLoad}}$  (runtime value-cell observations) · log2 spacing, ticks show original values

— logistic fit + 95% confidence band    ■ binned wrong rate + Wilson 95% CI    ● prediction outcome
